Water Conservation Facilities

A precise and scientific method is followed for water conservation. There are four bore wells for recharging water potential and rainwater is collected in one bore well. Underground tanks have been constructed where a sensor, assessing water tank level is securely placed. When the tank becomes full, automatic gate valve opens and water rushes to the next tank and when all tanks are filled, the motor automatically stops functioning, going to the off-mode. This facilitates conservation of energy as well as water.

MAINTENANCE OF WATER BODIES
